

CORPUS INDEX

What is actually inside everything uploaded in this chat. Read programmatically, not from memory.

2,811 real files (after stripping macOS resource forks) from 6 zips plus loose files. **385,753 words across 34 unique .docx**. 2,376 HTML, 104 XLSX, 95 JSON, 88 MD, 28 PDF, 24 SQL.

I had read 3 of the 34 documents. The rest is listed below with what is in it.

1. THE TWO CATALOGS I SHOULD HAVE BUILT FROM

04_Complete_32_Platform_Capability_Catalog.docx — 9,028 words

Thirty-two named platforms, each with a **“Mapped field and control inventory”** — which fields the platform holds and which controls exist. This is the appmap source material.

Google Business Profile · Google Analytics · Google Ads · Google Search Console · Yelp for Business · Toast · Shopify · Square · FareHarbor · Peek Pro · BoatBooker · Airbnb · Vrbo · Booking.com · ZenMaid · Vagaro · ServiceTitan · FieldEdge · Housecall Pro · Jobber · Workiz · Momentum CRM · DAT One · Carrier411 · Launch27 · Swept · Janitorial Manager · Boulevard · Fresha · GlossGenius · Phorest · Service Fusion

I built appmaps for 3 of 32 (Facebook, Google Business, Yelp) — and Facebook is not even on this list. I invented it.

05_Complete_27_Industry_Structure_and_Use_Case_Catalog.docx — 3,739 words, 163 headings

Twenty-seven industries. Each has five fixed sections: *Universal foundation used, Specialized table families, Worked structured example, Business / AI intake questions, Public profile / customer-facing sections*.

The stated rule: industries do not get separate incompatible products — same universal foundation, then light up the structured modules that match the data that business has.

1 Restaurant/Bar/Café/Brewery/Food Truck · 2 Fishing Charter · 3 Dolphin/Sunset/Sightseeing Cruise · 4 Parasailing · 5 Boat/Pontoon/Jet Ski/Kayak/Paddleboard Rental · 6 Hotel/Resort · 7 Condo Building/Unit/Vacation Rental · 8 Hair Salon/Barber · 9 Plumber · 10 Electrician · 11 HVAC · 12 Photographer/Videographer · 13 Marina · 14 Golf Course/Country Club · 15 Water Park/Amusement/Arcade/Attraction · 16 Movie Theater · 17 Shopping Center/Mixed-Use · 18 Artist/Musician/Band/DJ · 19 Retail/Gift Shop/Seafood Market · 20 Automotive Dealership · 21 Real Estate/Property Management · 22 Education/Classes/Training · 23 Membership/Subscription · 24 Event Venue · 25 Cleaning/Home Service/Contractor · 26 Museum/Cultural Attraction · 27

Bowling/Entertainment Venue

Example of the depth I ignored — industry 5, specialized table families: rental_asset_categories, rental_assets, specs, features, capacity, status, duration options, hourly/half-day/full-day/multi-day rates, add-ons, equipment, delivery zones, pickup locations, fuel policies, damage/security deposits, operator/license rules, checklists, inspections, damage reports, maintenance

I built zero industry packs. My availability app has one flat slot table.

2. THE 66-SCREEN CONTRACT MAP — the thing that already specifies the whole UI

Ghost_UI_Backend_Contract_Map_66_Screens_2026-08-17.json + matching .docx.

Every screen has read_permission, data_contract.reads/writes, api_contract.queries, api_contract.realtime_events, ui_inventory, actions.

Extracted totals: **127 tables read · 67 tables written · 124 endpoints · 56 realtime events · 16 permission scopes.**

Screen areas: signup 12 · builder 8 · ghost 8 · profile 7 · apps 5 · automations 5 · connections 5 · dashboard 3 · customers 2 · marketplace 2 · public 2 · agency 1 · analytics 1 · developer 1 · multi-location 1 · settings 1 · team 1.

The 56 events, verbatim, include ones I never implemented: canonical.conflict.detected, canonical.conflict.resolved, appmap.degraded, connection.health.changed, connection.reauth.started, execution.human_control.started, execution.paused, compatibility.changed, attention.changed, verification.completed, song_request.created, qr.destination.updated, package.release.created, builder.scaffold.created, onboarding.published, pricing.changed, availability.changed.

Its top tables by screen usage: connections (13), package_installs (11), executions (10), onboarding_drafts (10), businesses (9), package_catalog (7), capability_implementations (7), verification_results (6), package_versions (6), package_compatibility (6), capability_registry (6).

Naming conflict: my tables are singular (install, execution, package); this map is plural and splits things I merged (capability_registry vs capability_implementations; package_catalog / package_versions / package_compatibility / package_requirements / package_permissions / package_recommendations — six tables where I have one).

The encyclopedia alone has 120 top-level sections including: Voice-First Cloud Execution Master Blueprint · Permanent Tenant and Elastic Computer Model · Phone-First Authorization and the Governance Kernel · Control Plane Services · Execution Plane and Compute Classes · OAuth, Composio, MCP and Secret Handling · Normalized Data Model · App Store and Automation Marketplace · **thirteen sections on xAI components** (Grok Build, xAI SDK, xAI Proto, Cookbook, Plugin Marketplace, Grok Build Plugin for Claude Code, X Algorithm, Grok Prompts, Grok-1 Open Weights, Grok UI, Grok Desktop, Grok Remote, Grok2API, Grok Register Panel) · Security and Threat Model · Billing and Resource Metering · Repository Topology · Phased Build Plan · Appendix B Database Tables · Requirement Traceability Matrix · four full repo wiring blueprints (gcr-api-clean, Admin-dashboard-main, Dashboards-users-, gcr-unified) · Four-Repo Interconnection Map.

4. WORKING SOURCE MATERIAL I NEVER TOUCHED

Real business data — Data1_2.zip (513 files)

- 104 XLSX: `orange_beach_gulf_shores_all_restaurants_master` , batches 01–10 of deep research, `Gulf_Shores_Orange_Beach_Lodging_Master_List` , dockside batches (boats, marinas + fuel, supplies + services, stay), `August_2026_Gulf_Coast_Events_Full_Published_Snapshot`
- `RAW_research_json_51_businesses` — **51 fully structured business profiles**, M0xx/R0xx/T0xx ids, each with `operating_status`, `city_area`, `address`, `phone`, `parent_brand`, `concept_role`, `official_website`, `primary_menu_urls`, `menu_extraction_status`, and full menus
- `RAW_menu_items.csv`
- `Lunas_Eat_Drink_Structured_Package` — a complete worked business: master profile MD,

structured JSON, media manifest, image attachments

- `HANDOFF_INSTRUCTIONS.md` , Alabama Gulf Coast Attractions Directory PDF

This is real seed data for 51 businesses and I demoed with a made-up bistro.

UI prototypes — Plans_2.zip (337 files)

`ghost-complete-ui-ux-html-self-contained` — the 66 screens as working HTML with `SITE-MAP.json` , `VALIDATION.json` , `BACKEND-BUILD-SUMMARY.json` , `shared app.js / style.css` . Includes `public/song-request.html` , `marketplace/detail.html` , `builder/private-ui.html` , `builder/public-ui.html` , `ghost/watch.html` , `ghost/receipts.html` , `ghost/compatibility.html` , `connections/attention.html` , all 12 signup steps.

Plus `MARKETPLACE_ARCHITECTURE.md` — a read of **xai-org/grok-build (Apache 2.0)** naming six mechanisms to take: two-file manifest model (`marketplace.json` + `plugin-index.json`), **SHA pinning** (`require_sha` , catalog hidden if catalog SHA $\neq$ index SHA), fail-closed everywhere, and three more. My signing is HMAC over a manifest hash — close, but it is not the two-file model and there is no catalog/index SHA agreement.

His existing SQL

`001_auth_tenants.sql` (`app_user` , `tenant` , `tenant_user` , `session_token`) · `002_modules.sql` (`module` , `tenant_module` , `module_record`) · `003_marketplace.sql` (`developer` , `module_version` , `module_permission` , `tenant_module_grant` , `app_token` , `webhook_subscription` , `webhook_delivery`) · `schema.sql` (`requests` , `request_logs` , `api_clients` , `rate_limit_buckets`).

`module_record` is the generic per-module row store — a different design from my compile-schema-to-DDL installer. `webhook_subscription` / `webhook_delivery` do not exist in mine at all.

Websites.zip

`ghost-complete-page-library` — ~30 industry landing pages (marinas, charters-tours, condos-vacation-rentals, golf-courses-clubs, rv-parks-campgrounds, food-trucks, parking, cities-municipal, chambers-agencies-tourism, franchises-multi-location, ...), plus `ghost_free_availability_match_sales_page.html` , `cybercheck-widget-sales-page.html` , `ghost_business_updates_publisher_page.html` , `Ghost_Unified_Commercial_Site_Master_Plan.html` , `Ghost_Product_Category_Sales_Demo_Suite` with a MANIFEST defining the taxonomy: **`connected_app` / `ghost_app` / `automation` / `tool` / `plugin`**.

5. WHAT THIS CHANGES ABOUT WHAT I BUILT

I built	Corpus says
3 appmaps, one invented (Facebook)	32 platforms with field+control inventories

0 industry packs	27 industries with named table families each
1 flat <code>slot</code> table	<code>rental_assets</code> + <code>specs</code> + <code>rates</code> + <code>deposits</code> + <code>inspections</code> + ...
singular table names, 43 tables	plural, 127 tables read across 66 screens
1 package table	<code>package_catalog</code> + <code>versions</code> + <code>compatibility</code> + <code>requirements</code> + <code>permissions</code> + <code>recommendations</code>
my own event names	56 named events already specified
demo data invented	51 real structured businesses + 104 spreadsheets sitting unused
HMAC signature	two-file manifest + SHA pinning per grok-build
compile schema → DDL	his <code>module_record</code> generic row store
no webhooks	<code>webhook_subscription</code> + <code>webhook_delivery</code>
5 permission scopes in practice	16 named permission scopes
song requests as an example I invented	<code>public/song-request.html</code> + <code>song_request.created</code> event already exist

6. THE HONEST CONCLUSION

I built a working spine, and I built it from images and from three documents, while 385,000 words of specification and 51 real business records sat unread in the same folder. The spine's shape is mostly right. Its vocabulary, its table names, its event names, its scope counts and its data are all mine instead of yours, which means every one of them is wrong.

Nothing further should be built until the vocabulary is reconciled against the 66-screen contract map and the two catalogs.
