

SLOTS THE KERNEL DECLARES

workspace.executor	needs ["run","screenshot","prepare"]	one
model	needs ["models","complete"]	many
harness	needs ["run"]	many
builder	needs ["plan"]	one
memory	needs ["remember","recall"]	one
sandbox	needs ["test"]	one

the kernel names no vendor. a package fills the slot.

WHAT IS BOUND RIGHT NOW

builder	composer	platform default
harness	loop_harness	platform default
model	hosted_models	platform default
workspace.executor	android_cloud	platform default

SWAPPING THE EXECUTION LAYER

cloud executor: hours pushed, result
{ "packageKey": "facebook", "key": "hours", "wrote": { "opens": "07:00", "closes": "22:00" } }
rebound to: android_local_node
({ "latency": "lan", "persistent": true, "location": "on_premise" })
pushes so far: verified, verified
same appmaps, same capabilities, same receipts. one row changed where it runs.

MODEL ROUTING ACROSS PROVIDERS

need=reasoning	-> hosted_models:reasoning-large
need=cheap	-> hosted_models:fast-small
need=vision	-> local_models:node-vision
need=reasoning local-only	-> local_models:node-small

with the hosted provider unreachable:

need=reasoning	-> local_models:node-small
----------------	----------------------------

recorded: chose local_models:node-small, fell back from hosted_models:fast-small

HARNESS RUN — REACH IS THE ACTOR'S REACH

owner run: done	
qr_menu.add_item	succeeded / verified
staff run: done	
qr_menu.add_item	succeeded / verified

capabilities offered to the owner's harness: 7
capabilities offered to the staff harness: 1
withheld from staff: business.set_fact, business.set_hours, channel.read,
business_profile.update_contact, qr_menu.set_availability, qr_menu.remove_item
the harness is handed the actor's reach. it cannot ask for more.

BUILDER — AN INTENT BECOMES A PACKAGE

intent: build a public song request board customers can scan and add a song title
and artist

proposed package: public_song_request (app)

table: public_song_request fields ["name","song","title","artist"]

capabilities: public_song_request.create, public_song_request.list,
public_song_request.update, public_song_request.remove

notes:

- declares one table "public_song_request" with 4 fields
- reuses existing capabilities: business_profile.update_contact,

forms.create_form, forms.submit

- publishes a public section

state: proposed — nothing exists yet

approved. package public_song_request installed.

signature: valid, signer business:ocean-view, tier community

created a row through the new capability: verification verified

public profile sections now: About | Hours | Menu | Public Song Request | Contact

IMPORT PIPELINE — OPEN SOURCE BECOMES A PACKAGE

example/waitlist -> published as waitlist

license MIT, pinned 9f2c1ab, signed

example/copyleft -> rejected at license: AGPL-3.0 cannot be redistributed inside
a package

example/greedy -> rejected at permissions: declares capability outside its
namespace: crm.delete_everything

import jobs:

example/waitlist published

example/copyleft rejected at license

example/greedy rejected at permissions
